

I feel it would be an AWESOME idea to utilize broadband over power lines. If excellent speeds are available, they should be used to the fullest extent possible.

Lots of people live in rural areas that cannot access DSL or cable, even something

like ISDN, but with power lines, every home will have instant broadband access, something which is becoming more of a necessity than a luxury in the U.S.A.

Also,

there should be no limitations on using broadband over power lines like there is with other traditional means, especially prohibiting running servers from homes,

and limiting upload and download speeds. If we live in such a free country, there

should be no problems in running servers from the power lines. Live free or die!

Thank you.
